1 Introduction

1.1 Grid-based Hamilton-Jacobi-Isaacs evaluations

1.2 Fixed-grid pseudospectral methods

1.3 Thesis statement

1.4 Outline of contributions

2 The Model Problem

- 2.1 Abstract formulation of the multi-phase optimal control problem
- 2.2 The degenerate case: equilibrium glide
- 2.3 The oscillatory and hybrid cases: FOBS and Sänger-type skips
- 2.4 Quantity of interest and uncertainty

3 Infinite-Dimensional Embedding and Measure Theory

3.1 Sobolev space formulation

3.2 Distributional jumps and weak derivatives

3.3 The Liouville PDE and occupation measures

4 Concentration-Compactness and Moment Closure

4.1 Prokhorov's theorem and Dirac masses

4.2 The Galerkin projection and Riccati collapse

4.3 Non-ellipsoidal bounds via barrier certificates

5 Bounding Limits and Certificates

5.1 Filippov-Ważewski relaxation

5.2 Certified outer bounds

5.3 Inner point cloud

6 Verification and Results

6.1 Validating the degenerate limit

6.2 The oscillatory and synergetic demonstration

6.3 Phase linkage verification

6.4 Reproducibility environment

7 Discussion

7.1 System diagnostics and computational cost

7.2 Implications for defense modeling
